

Danger or Delicacy?

This map shows the largest international trade routes for edible jellyfish products (HS code 030830) in 2025, with arrow thickness representing relative volume by net weight (kg).

The map focuses on the Eastern Hemisphere because the dominant trade network is concentrated across South, Southeast, and East Asia, with China as the largest destination market and Malaysia and Japan as important regional hubs. Duplicate country-to-country records were simplified by retaining the larger reported net weight to avoid double-counting and improve clarity.

Jellyfish are widely consumed in parts of Asia in dishes such as liángbàn hǎizhé (China), chūka kurage (Japan), Yen Ta Fo (Thailand), Haepari naengchae (Korea), and Kerabu Hai Tay (Malaysia). However, they remain relatively unfamiliar as food in Western contexts⁸. This map, therefore, shifts the narrative from seeing jellyfish as hazards to seeing them as a usable marine resource.
