

Malaria Cases Have Declined Across Much of the Region Since 2000

This map illustrates the change in the proportion of detected malaria cases in children aged 2-10 years old between the year 2000 and 2024 in the DRC. Areas with no shading or pink shading represent the areas where malaria cases have declined, while areas shaded in dark red represent the areas where malaria cases have increased. Hospital clusters are also included to provide context on healthcare access across the region. Overall, most areas are either unshaded or light pink, indicating that much of the region has experienced a decline in malaria cases over time, with areas near hospitals experiencing greater declines in malaria cases.
